### 1.1 Variants

We need to generate temporarily a few e-types variants of kernel backend commands. These can be removed once the kernel provides them.

```
26 <@@=pdf>
27 <*luatex | pdftex>
28 \cs_generate_variant:Nn \__kernel_backend_literal_page:n { e }
```

---

\*E-mail: [latex-team@latex-project.org](mailto:latex-team@latex-project.org)

```

29 </luatex | pdftex>
30 < *dvipdfmx | xdvipdfmx>
31 \cs_generate_variant:Nn \__kernel_backend_literal:n { e }
32 \cs_generate_variant:Nn \__pdf_backend:n { e }
33 </dvipdfmx | xdvipdfmx>
34 < *dvips>
35 \cs_generate_variant:Nn \__kernel_backend_postscript:n { e }
36 \cs_generate_variant:Nn \__pdf_backend_pdfmark:n { e }
37 </dvips>

```

## 1.2 Support for delayed literal and special

Starting with TeXlive 2023 the engines support a `shipout` keyword for `\pdfliteral` and `\special`. When used the argument is not expanded when the command is used but only when the page is shipped out. This allows for example the tagging code to delay the page-wise numbering of MC-chunks until the page is actually built. For now we test the engine support. The boolean is setup in `pdfmanagement-testphase.dtx`.

```

38 < *drivers>

```

The following commands provide the needed kernel backend support. This are basically copies of similar commands of `l3backend-basics`.

`\__kernel_backend_shipout_literal:e` The one shared function for all backends is access to the basic `\special` primitive.

```

39 \bool_if:NT \l__pdfmanagement_delayed_shipout_bool
40 {
41   \cs_new_protected:Npn \__kernel_backend_shipout_literal:e #1
42     { \tex_special:D~shipout { #1 } }
43 </drivers>

```

*(End of definition for \\_\_kernel\_backend\_shipout\_literal:e.)*

```

44 < *luatex | pdftex>

```

`\__kernel_backend_shipout_literal_pdf:e` This is equivalent to `\special{pdf:}` but the engine can track it. Without the `direct` keyword everything is kept in sync: the transformation matrix is set to the current point automatically. Note that this is still inside the text (BT ...ET block).

```

45 \cs_new_protected:Npn \__kernel_backend_shipout_literal_pdf:e #1
46 {
47 < *luatex>
48   \tex_pdfextension:D ~ literal ~ shipout ~
49 </luatex>
50 < *pdftex>
51   \tex_pdfliteral:D ~ shipout ~
52 </pdftex>
53   { #1 }
54 }

```

*(End of definition for \\_\_kernel\_backend\_shipout\_literal\_pdf:e.)*

`\__kernel_backend_shipout_literal_page:e` Page literals are pretty simple.

```

55 \cs_new_protected:Npn \__kernel_backend_shipout_literal_page:e #1
56 {
57 < *luatex>
58   \tex_pdfextension:D ~ literal ~ shipout ~
59 </luatex>

```

```

60 <*pdfTeX>
61     \tex_pdfliteral:D ~ shipout ~
62 </pdfTeX>
63     page { #1 }
64 }
65 </luatex | pdfTeX>
66 <drivers> }

```

(End of definition for \\_\_kernel\_backend\_shipout\_literal\_page:e.)

### 1.3 Crossreferences

## 1.4 luacode

Load the lua code.

```
96 <*luatex>
97     \directlua { require("l3backend-testphase.lua") }
98 </luatex>
```

## 1.5 Converting unicode strings to a pdfname

dvips needs a special function here, so we add this as backend function.

```
99 <*pdftex | luatex | dvipdfmx | xdvipdfmx | dvisvgm>
100 \cs_new:Npn \__kernel_pdf_name_from_unicode_e:n #1
101 {
102     / \str_convert_pdfname:e { \text_expand:n { #1 } }
103 }
104 </pdftex | luatex | dvipdfmx | xdvipdfmx | dvisvgm>
105 <*dvips>
106 \cs_new:Npn \__kernel_pdf_name_from_unicode_e:n #1
107 {
108     ~ ( \text_expand:n { #1 } ) ~ cvn
109 }
110 </dvips>
```

## 1.6 Hooks

### 1.6.1 Add the “end run” hooks

Here we add the end run hook to suitable end hooks.

```
111 <*pdftex | luatex>
112 % put in \@kernel@after@enddocument@afterlastpage
113 \tl_gput_right:Nn \@kernel@after@enddocument@afterlastpage
114 {
115     \g__kernel_pdfmanagement_end_run_code_tl
116 }
117 </pdftex | luatex>
118 <*dvipdfmx | xdvipdfmx>
119 % put in \@kernel@after@shipout@lastpage
120 \tl_gput_right:Nn \@kernel@after@shipout@lastpage
121 {
122     \g__kernel_pdfmanagement_end_run_code_tl
123 }
124 </dvipdfmx | xdvipdfmx>
125 <*dvips>
126 % put in \@kernel@after@shipout@lastpage
127 \tl_gput_right:Nn \@kernel@after@shipout@lastpage
128 {
129     \g__kernel_pdfmanagement_end_run_code_tl
130 }
131 </dvips>
```

### 1.6.2 Add the “shipout” hooks

Now we add to the shipout hooks the relevant token lists. We also push the page resources in shipout/firstpage (AtBeginDvi) as the backend code sets color stack there. The xetex driver needs a rule here. If it clashes on the first page, we will need a test ...

```

132 <*drivers>
133 \tl_if_exist:NTF \@kernel@after@shipout@background
134 {
135   \g@addto@macro \@kernel@before@shipout@background{\relax}
136   \g@addto@macro \@kernel@after@shipout@background
137   {
138     \g__kernel_pdfmanagement_thispage_shipout_code_tl
139   }
140 }
141 {
142   \hook_gput_code:nnn{shipout/background}{pdf}
143   {
144     \g__kernel_pdfmanagement_thispage_shipout_code_tl
145   }
146 }
147
148 </drivers>

```

### 1.7 The /Pages dictionary (pdfpagesattr)

\\_pdf\_backend\_Pages\_primitive:n

This is the primitive command to add something to the /Pages dictionary. It works differently for the backends: pdftex and luatex overwrite existing content, dvips and dvipdfmx are additive. luatex sets it in lua. The higher level code has to take this into account.

```

149 <*pdftex>
150 \cs_new_protected:Npn \_pdf_backend_Pages_primitive:n #1
151 {
152   \tex_global:D \tex_pdfpagesattr:D { #1 }

163       pdf.setpagesattributes( \_pdf_backend_luastring:n { #1 } )
164     }
165   }
166 }
167 </luatex>

(End of definition for \\_\_pdf\_backend\_Pages\_primitive:n.)

## 1.8 “Page” and “ThisPage” attributes (pdfpageattr)

\\_\_pdf\_backend\_Page\_primitive:n is the primitive command to add something to the /Page dictionary. It works differently for the backends: pdftex and luatex overwrite existing content, dvips and dvipdfmx are additive. luatex sets it in lua. The higher level code has to take this into account. \\_\_pdf\_backend\_Page\_gput:nn stores default values. \\_\_pdf\_backend\_Page\_gremove:n allows to remove a value. \\_\_pdf\_backend\_ThisPage\_gput:nn adds a value to the current page. \\_\_pdf\_backend\_ThisPage\_gpush:n merges the default and the current page values and add them to the dictionary of the current page in \g\_\_pdf\_backend\_thispage\_shipout\_tl.

```

## 1.9 “Page/Resources”: ExtGState, ColorSpace, Shading, Pattern

Path: Page/Resources/ExtGState etc. The actual output of the resources is handled together with the bdc/Properties. Here is only special code.

`\c__pdf_backend_PageResources_clist` The names are quite often needed a similar list is now in l3pdfmanagement. Perhaps it should be merged.

```

419 <*drivers>
420 \clist_const:Nn \c__pdf_backend_PageResources_clist
421 {
422     ExtGState,
423     ColorSpace,
424     Pattern,
425     Shading,
426 }
427 </drivers>

```

(End of definition for `\c__pdf_backend_PageResources_clist`.)

Now the backend commands the command to fill the register and to push the values.

`\__pdf_backend_PageResources_gput:nnn` stores values for the page resources.

**#1** : name of the resource (ExtGState, ColorSpace, Shading, Pattern)  
**#2** : a pdf name without slash  
**#3** : value

`\__pdf_backend_PageResources_obj_gpush:`

This pushes out the objects. It should be a no-op with xdvipdfmx and dvips as it currently issued in the end-of-run hook! create the backend objects:

```

428 <*pdfTeX | luatex>
429 \clist_map_inline:Nn \c__pdf_backend_PageResources_clist
430 {
431     \pdf_object_new:n {\__pdf/Page/Resources/#1}

434         \tex_directlua:D
435         {
436             ltx.__pdf.object["__pdf/Page/Resources/#1"]
437             =
438             "\__pdf_backend_object_ref:n{\__pdf/Page/Resources/#1}"
439         }
440     }
441 }
442 </pdfTeX | luatex>

```

values are only stored in a prop and will be output at end document. luatex must also trigger the lua side

```

xdvipdfmx doesn't work correctly with object names ... <https://tug.org/pipermail/dvipdfmx/2019-August/000021.html>, so we use this must be issued on every page! objects should not only be created but also initialized initialization should be done before anyone tries to write so we add rules for the backend. The push command should not be used as it is in the wrong end document hook. If needed a new command must be added.

## 1.10 “Catalog” & subdirectories (pdfcatalog)

The backend command is already in the driver: \\_\_pdf\_backend\_catalog\_gput:nn

### 1.10.1 Special case: the /Names/EmbeddedFiles dictionary

Entries to /Names are handled differently, in part (/Desc) it is automatic, for other special commands like \pdfnames must be used. For EmbeddedFiles dvips wants code for every file and then creates the Name tree automatically. Other name trees are ignored. TODO: Currently the code for EmbeddedFiles is still a bit different but this should be merged, all name trees should be handled with the same code.

```

905 % pdflatex

EmbeddedFiles is a bit special. For once we need backend commands for dvips. But we want also an option to create the name on the fly.

\\_\_pdf\_backend\_NamesEmbeddedFiles\_add:nn dvips need special backend code to create the name tree. With the other engines it does nothing.

The xform code for dvips is based on code from the attachfile2 package (in atfi-dvips), along with some ideas from pdfbase and has been corrected with the help of Alexander Grahn. Details like clipping and landscape will probably be corrected in the future. We need some temporary variables to store dimensions

## 1.11 Structure Destinations

Standard destinations consist of a reference to a page in the pdf and instructions how to display it—typically they will put a specific location in the left top corner of the viewer and so give the impression that a link jumped to the word in this place. But in reality they are not connected to the content.

Starting with pdf 2.0 destinations can in a tagged PDF also point to a structure, to a `/StructElem` object. `GoTo` links can then additionally to the `/D` key pointing to a page destination also point to such a structure destination with an `/SD` key. Programs that e.g. convert such a PDF to html can then create better links. (According to the reference, PDF-viewer should prefer the structure destination over the page destination, but as far as it is known this isn’t done yet.)

Currently structure destinations and `GoTo` links making use of it could natively only be created with the `dvipdfmx` backend. With `pdftex` and `lualatex` it was only possible to create a restricted type which used only the “Fit” mode. Starting with `TEXlive 2022`

(earlier in miktex) both engine will know new keywords which allow to create structure destination easily.

The following backend code prepares the use of structure destinations. The general idea is that if structure destinations are used, they should be used always. So we define alternative commands which can be activated by mapping them to the standard backend commands.

`\l_pdf_current_structure_destination_tl`

This command holds the name of the structure object to use in the next command which creates a destination. The code which activates structure destinations must also ensure that it has a sensible, expandable content. `tagpdf` for example will define it as

```
\tl_set:Nn \l_pdf_current_structure_destination_tl { __tag/struct/\g__tag_struct_stack
1399 <*drivers>
1400 \tl_new:N \l_pdf_current_structure_destination_tl
1401 </drivers>
```

*(End of definition for \l\_pdf\_current\_structure\_destination\_tl. This function is documented on page ??.)*

We will define alternatives for three backend commands:

```
\__pdf_backend_destination:nn      -> \__pdf_backend_structure_destination:nn
\__pdf_backend_destination:nnnn -> \__pdf_backend_structure_destination:nnnn
\__pdf_backend_link_begin_goto:nnw -> \__pdf_backend_link_begin_structure_goto:nnw
```

Activating means mapping them onto the original commands. Be aware that not all engines and compilation routes support structure destinations, for them the command will be a no-op.

`\pdf_activate_structure_destination:`

```
1402 <*drivers>
1403 \cs_new_protected:Npn \pdf_activate_structure_destination:
1404 {
1405   \cs_gset_eq:NN \__pdf_backend_destination:nn \__pdf_backend_structure_destination:nn
1406   \cs_gset_eq:NN \__pdf_backend_destination:nnnn \__pdf_backend_structure_destination:nnnn
1407   \cs_gset_eq:NN \__pdf_backend_link_begin_goto:nnw \__pdf_backend_link_begin_structure_goto:nnw
1408 }
1409 </drivers>
```

*(End of definition for \pdf\_activate\_structure\_destination:. This function is documented on page ??.)*

Now the driver dependant parts. By default the new commands are simply copies of the original commands. We adapt them then for the engines and engine version which provide support for structure destinations.

```
1410 <*drivers>
1411 \cs_set_eq:NN \__pdf_backend_structure_destination:nn \__pdf_backend_destination:nn
1412 \cs_set_eq:NN \__pdf_backend_structure_destination:nnnn \__pdf_backend_destination:nnnn
1413 \cs_set_eq:NN \__pdf_backend_link_begin_structure_goto:nnw \__pdf_backend_link_begin_goto:nnw
1414 </drivers>
```

`\__pdf_backend_structure_destination:nn`

This command is the backend command to create a destination. It should in parallel create also a structure destination. At first xetex/dvipdfmx. The structure destination is an array, so we use obj for it so that we can reference it:

```
1415 <*xdvipdfmx | dvipdfmx>
```

```

1416 \cs_set_protected:Npn \__pdf_backend_structure_destination:nn #1#2
1417 {
1418   \__pdf_backend:e
1419   {
1420     dest ~ ( \exp_not:n {#1} )
1421     [
1422       @thispage
1423       \str_case:nnF {#2}
1424       {
1425         { xyz } { /XYZ ~ @xpos ~ @ypos ~ null }
1426         { fit } { /Fit }
1427         { fitb } { /FitB }
1428         { fitbh } { /FitBH }
1429         { fitbv } { /FitBV ~ @xpos }
1430         { fith } { /FitH ~ @ypos }
1431         { fitv } { /FitV ~ @xpos }
1432         { fitr } { /Fit }
1433       }
1434       { /XYZ ~ @xpos ~ @ypos ~ \fp_eval:n { (#2) / 100 } }
1435     ]
1436   }

```

We test if the structure object exist. The object of the structure destination gets the name `@pdf.Sdest.<destname>`, where `<destname>` is the name of the standard destination so that we can reference it in the GoTo links.

```

1437 \exp_args:Ne \pdf_object_if_exist:nT { \l_pdf_current_structure_destination_tl }
1438 {
1439   \__pdf_backend:e
1440   {
1441     obj ~ @pdf.Sdest.\exp_not:n{#1}
1442     [
1443       \exp_args:Ne \pdf_object_ref:n { \l_pdf_current_structure_destination_tl }
1444       \str_case:nnF {#2}
1445       {
1446         { xyz } { /XYZ ~ @xpos ~ @ypos ~ null }
1447         { fit } { /Fit }
1448         { fitb } { /FitB }
1449         { fitbh } { /FitBH }
1450         { fitbv } { /FitBV ~ @xpos }
1451         { fith } { /FitH ~ @ypos }
1452         { fitv } { /FitV ~ @xpos }
1453         { fitr } { /Fit }
1454       }
1455       { /XYZ ~ @xpos ~ @ypos ~ \fp_eval:n { (#2) / 100 } }
1456     ]
1457   }
1458 }
1459 }

```

The second destination command is for the boxed destination. Here we need to define a new auxiliary command:

```

1460 \cs_new_protected:Npn \__pdf_backend_structure_destination_aux:nnnn #1#2#3#4
1461 {
1462   \vbox_to_zero:n
1463   {

```

```

1464     \__kernel_kern:n {#4}
1465     \hbox:n
1466     {
1467         \__pdf_backend:n { obj ~ @pdf_ #2 _llx ~ @xpos }
1468         \__pdf_backend:n { obj ~ @pdf_ #2 _lly ~ @ypos }
1469     }
1470     \tex_vss:D
1471 }
1472 \__kernel_kern:n {#1}
1473 \vbox_to_zero:n
1474 {
1475     \__kernel_kern:n { -#3 }
1476     \hbox:n
1477     {
1478         \__pdf_backend:n
1479         {
1480             dest ~ (#2)
1481             [
1482                 @thispage
1483                 /FitR ~
1484                 @pdf_ #2 _llx ~ @pdf_ #2 _lly ~
1485                 @xpos ~ @ypos
1486             ]
1487         }
1488     }

```

Here we add the structure destination to the same box

```

1488     \exp_args:Ne \pdf_object_if_exist:nT { \l_pdf_current_structure_destination_tl }
1489     {

### 1.13 Uncompressed metadata object stream

The xmp metadata should be written “uncompressed” to pdf. It is not quite clear what exactly that means. Probably it only means that there should be no `/Filter` key in the stream, but packages like `pdfx` and `hyperref` try to suppress object compression too, so we add support for it too. With `luatex` this is possible by using the `uncompressed` key word. With `pdftex` one can change locally the `compresslevel`. (x)dvipdfmx does it automatically and doesn’t need some special command. No solution is known for the dvips route. We need it only once, so we make it special and probably no public interface is needed. It writes an unnamed object so should be referenced directly with `\pdf_object_ref_last`:

```

1720 <*luatex>
1721 \cs_new_protected:Npn \__pdf_backend_metadata_stream:n #1

```

### 1.14 Suppressing deprecated PDF features

`/ProcSet`, `/CharSet` and the `/Info` dictionary are deprecated in PDF 2.0. For the pdf/A-4 standard they must be suppressed. Not every engine is able to do this, but for pdfTeX and luatex we define suitable backend command. `/ProcSet` is suppressed automatically for pdf version 2.0 starting with in texlive 2023.

`\__pdf_backend_omit_charset:n` The option to omit `/CharSet` exists already for quite some time for the two engines.

```
